Animation Development Brief

We have included a video render of an animation that was created previously for a client. What we would like from this deliverable is a new approach to the content development.

What would we like to see?

- HTML – Clean semantic code
- SCSS - Usage of key frame animations, common conventions such as mixins and extends if or where possible
- Delivery of animation - Add your own touch to the animations, you can choose to replicate the animations in the video or improve on them with your own style. Show me your skills. I'm looking to see how you would structure a web document and style sheet first, animation secondary ☺
- JavaScript - function that activates animations
    - If the function activate is executed the animations will begin
    - If the function deactivate is executed the animations will stop
- There is no time limit on the task, feel free to deliver the task with what you are comfortable with.

Content
Container should be 1920px width & 1080px height, with overflow: hidden style applied.
